

BVD herd screening

Gribbles Veterinary has a BVD screening tool for cattle that provides a more cost effective solution for screening large numbers of animals than existing PCR or ELISA options.

BVD PCR results are given for each pool of samples, providing a quick and easy screen, and they let you know if further investigation to identify PI animals is required (pools are up to 40 samples in size)*.

The benefits of this new PCR screening test include:

- Suitable for screening dry-stock
- All animals tested must be >35 days old
- Suitable as a tool for BVD investigations in milking animals reducing the requirement for individual testing
- The pooled result is a much more cost effective option for large numbers of animals
- Individual testing **only** done on request for positive pools, saving you MOO-lah.

Simply tick BVD SCREEN on your submission form to take advantage of this cost-saving testing regime.

Note:

**Individual testing on positive pools will only be carried out on request and will be charged per our current pricelist. If you would prefer testing on positive pools to be carried with having to request it, please select our routine BVD PCR test instead.*

Please refer to our current price book for sample types, test turn-around times and pricing. If you have any questions or would like any further information, please contact your local Gribbles Veterinary laboratory or Territory Manager.
